

Modular Data Centers

Modular Data Centers

A modular data center is a portable, prefabricated data center system made from standardized components. Think of it like a set of building blocks for a data center. These modules, which can be the size of a shipping container, are built and tested off-site in a factory.

- **Prefabricated:** Built in a factory environment with strict quality control.
- **Scalable:** You can add modules as your needs grow, allowing for a "pay-as-you-grow" model.
- **Portable:** Can be easily transported and deployed in various locations.
- **Rapid Deployment:** Installation time is significantly reduced from years to a matter of weeks or months.
